1. INTRODUCTION

The Yale Department of Computer Science was founded in 1969 as a small Ph.D. program. It now has over 100 graduate students, including both Ph.D. and master’s degree students.

The Ph.D. program in Computer Science stresses unique and innovative research. Toward that end, the course requirements are modest, and students normally begin research by the fall term of their second year of graduate study. The Terminal M.S. degree program in Computer Science brings students to the cutting edge of the field and provides them with a solid foundation on which to build their future careers.

In 2001, Yale celebrated its 300th anniversary. The Department of Computer Science is almost an order of magnitude younger, reaching its 32nd birthday in the same year. But its influence on the university, within the research community, and on society as a whole belies its young age. Computers are a dominant presence in almost every walk of life, and the Yale community is increasingly dependent on and interested in them.

The Department of Computer Science was founded by people who had a vision. This vision was how computer science would fit into the unique spirit of Yale University, an institution oriented to an unusual degree around undergraduate education and close interdepartmental collaboration. The Department has always had close ties to mathematics and engineering, and in recent years it has developed collaborations with other disciplines important to Yale, including art, architecture, biology, psychology, economics, business, statistics, linguistics, music, medicine, and physics.

2. RESEARCH IN COMPUTER SCIENCE

An academic research effort in any field is supposed to establish outer boundaries. Commercial efforts demonstrate what is profitable; academic efforts show what is possible. In physics, mathematics, and the other large, long-established areas, most research leads to relatively small changes in the character and perimeter of the field. Computer science is different because it’s younger. When a few researchers parachuted into this field in the 1940’s, they had no territory to extend. They invented computer science from scratch. They faced basic questions in science, algorithms, design, and philosophy; by answering them, they established the intellectual basis of the field. What does “computable” mean? How do we classify computations, distinguishing practical from impractical from impossible? How programming languages should be designed, and what difference do they make? Is it possible in principle to build a mind out of software? And so on.

When the Department of Computer Science was founded in 1969, the fledgling field was viewed as comprising four primary areas: theory of computation, artificial intelligence, numerical analysis, and systems. Over the years, these areas have developed so quickly in both depth and breadth that each now contains many sub-areas. The original four areas are still represented in the Department, and they have been joined by other areas, including graphics, robotics, programming languages, and the cross-cutting area of security and privacy.

Computer Science has also become both a theoretical and an experimental discipline. For example, security theory establishes the correctness and robustness of idealized cryptographic protocols, but real systems need to be built and fielded to ensure that the protocols withstand realistic attacks. Type theory and category theory help establish the foundations of programming languages, but real languages need to be designed and built to ensure that programmers can use them productively. And learning and planning theory tells us what the limits of automated intelligence are, but robots need to be built to
demonstrate the viability of these results. At Yale, both theoretical research and applied research are valued highly.

Computer science has also become a multi-disciplinary field that touches many other sciences as well as arts and humanities. Aside from the obvious overlaps with engineering and mathematics, there are natural connections with physics, economics, law, management, psychology, biology, medicine, music, philosophy, and linguistics. Indeed, members of the computer science faculty have engaged in collaborations with researchers in each of these areas. These efforts have affected our curriculum through the establishment of cross-listed courses, interdisciplinary majors (such as cognitive science), special “tracks” and dual majors, and the creation of the Applied Math program. They have also led to interdisciplinary research centers, such as YINS (Yale Institute for Network Science, members of which come from CS, EE, and Sociology), the Center for Scientific Computing (members of which come from CS and Engineering), and the C2 Initiative (Creative Consilience of Computing and the Arts). C2 provides students with opportunities to apply mathematical, computational, and technological tools to problems inspired by the arts (Art, Art History, Music, Theater Studies, and Architecture).

Of course, with such diversity and depth, it has become increasingly difficult for any Department of Computer Science to cover all areas, and no department really tries to do so. The many changes that are taking place in the field have so far led Yale’s CS Department to pursue research in the following areas: algorithms and complexity theory, databases, distributed computing, machine learning, programming languages and compilers, scientific computing and applied math, graphics, vision and robotics, security, and cryptography, and Computing and the Arts. In March 2015, the Department joined Yale’s School of Engineering and Applied Science, and it is currently recruiting new faculty and broadening and deepening its efforts in both research and teaching.

### 3. GRADUATE PROGRAMS

The Department offers two graduate programs: a doctoral program leading to a Doctor of Philosophy (Ph.D.) degree and a terminal master’s program leading to a Master of Science (M.S.) degree. The doctoral program is intended for students who are preparing for research careers, in either academia or industry. The terminal master’s degree program is intended for students who want to pursue advanced study in computer science but do not necessarily intend to have research careers.

A student may apply to either the doctoral program or to the terminal master’s program. A student seeking the Ph.D. should apply directly to the doctoral program, even if he or she intends to obtain a master’s degree along the way. A student who has completed the master’s program and wishes to go on for a Ph.D. is not guaranteed admission to the doctoral program and is welcome to apply to it in the normal way.

Students should actively familiarize themselves with Yale Graduate School policy. Advising and mentoring are accomplished with a faculty advisor and the Director of Graduate Studies (DGS). Recommendations are outlined by the GSAS here.

#### 3.1 The Doctoral Program

The doctoral program of graduate study leads to the Ph.D. degree and is normally completed in 5 or 6 years. The M.S. and the M.Phil. Degrees are granted to qualified students in the doctoral program who wish to obtain intermediate degrees on the way to the Ph.D. If you are admitted to candidacy, the university registrar’s office will auto-petition an M.Phil. on your behalf. (See 3.1.6.)
3.1.1. AN OVERVIEW OF THE DOCTORAL PROGRAM

A typical Ph.D. student progresses through the program as follows:

**First Year**

A student is expected to take courses and familiarize himself or herself with the research activities underway in the Department. By the end of spring semester of the first year, the student must have teamed up with a research advisor, i.e., a faculty member who takes primary responsibility for the student's progress. Hence, every student should begin discussion with a professor (or professors) whom he or she might want to work with early in his or her first year (or even before he or she arrives) in order to identify an advisor.

After the first year, the student comes under the direction of a supervisory committee, consisting of the advisor and two or three other faculty members who monitor and mentor the student. Usually the committee forms “automatically” and consists of faculty working in the same area as the advisor, but there are many exceptions, especially when the student's work crosses disciplinary or departmental boundaries. In particular, if the day-to-day advisor's primary appointment is not in the Department of Computer Science, the committee must contain an “advisor of record” whose primary appointment is in CS. Once a student has selected a supervisory committee, changes to the committee require consultation among the director of graduate studies (DGS), the old committee, and the proposed new one. In rare cases, such changes may require the approval of the entire faculty.

**Second Year**

A student continues taking courses, completing a total of ten courses by the end of the year. Two of these must be the CPSC 690 and CPSC 691 sequence, in which the student carries out a research project and writes a report on the results; these are known as the “690 project” and the “690 report.” The end of the second year is the culmination of two years of study and research. He must also finish the project itself and submit the report. A copy of the approved report must be delivered to the registrar.

Each student must serve as a teaching fellow (TF) for two terms; this is a key part of academic training. First-year students are not normally eligible to serve as TFs; thus, this requirement typically becomes relevant in the second year. However, it is not necessary for the student to satisfy the teaching fellow requirement entirely in his or her second year.

**Area Exam**

The purpose of the area exam is to demonstrate scholarly proficiency in a subject area that includes the topic of the student's 690 project but is broader. The exam is formulated and administered by the student's supervisory committee. The committee must decide whether to give the same exam simultaneously to a cohort of students in the same area or to give a customized exam to each student in the area. Your advisor should email the DGS and the registrar in the department to record when the exam has been passed.

**Third Year**

A student is expected to begin their dissertation research, usually under the direction of the same supervisory committee but committee membership can be changed at this point, in view of the direction that the student’s research has taken during his or her second year. If the student or the original supervisory committee believes that the research is not going well, this is a good time to find a new
advisor, a new supervisory committee, and/or a new research topic. Students should notify the DGS of any difficulties they meet during their work with an advisor. The departmental registrar and the DGS must be notified in writing via email of the pending changes and any circumstances that led to the difficulties.

Completion and passing of a qualifying (area) exam along with submittal of a dissertation thesis are both due by the conclusion of the spring term in which you complete your third year in the doctoral program. While working on these milestones, students should register under CAND999.

**Admission to Candidacy**

The thesis committee will vote to admit the student to candidacy and admission will be approved by the DGS when all of the requirements described above have been satisfied:

1. course requirements (ten),
2. 690 project and report,
3. two terms of serving as a teaching fellow,
4. pass qualifying (area) exam
5. thesis advisor, and thesis prospectus

In the highly unlikely event that the Dissertation Committee and the DGS are not in agreement, the subsequent course of action will be decided by the Department Chair, on a case-by-case basis.

The prospectus is usually the last piece to fall into place, and it must be done before the thesis committee votes on admission to candidacy. The Graduate Administrative Dean will inquire about students who have not been admitted to candidacy starting in the beginning of their fourth year. If the student has not been admitted to candidacy by the end of the third year, the Graduate School will not allow the student to register for classes at the beginning of his or her fourth year or to be paid as a research assistant or TF.

Correcting this registration problem requires the Computer Science Department to negotiate with the Graduate School; negotiation usually results in the student’s being placed on probation for a term with the expressed intention of all concerned that he or she will be admitted to candidacy before the end of that term. The possibility of probation for one term should not be interpreted to mean that the “real” deadline for completion of requirements is August 31 of the year in question. Rather, as explained above, the spring term ends in May. The exact date on which the term ends in any particular year can be found in the Graduate School calendar; it is this end-of-term date this is the deadline for admission to candidacy.

**Post Third Year**

The Graduate School will not allow a student to register for a fourth year of study until this step has been completed. After admission to candidacy, the student’s position in the Department is secure, subject only to continued satisfactory progress toward completion of the dissertation. After achieving candidacy, students should register for DISR99 each term. When the dissertation is complete, it is defended before the faculty and approved by a committee of readers. It is turned into the Graduate School, and the readers file reports approving it. At this point, the DGS will approve the degree, so far as the department is concerned. In the unlikely event that the DGS fails to approve the degree, the subsequent course of action will be decided by the Department Chair, on a case-by-case basis. The requirements for the Ph.D. have been met, and the degree is granted.
The Dissertation

Each year a doctoral candidate works on their dissertation, an annual dissertation report must be filed and approved by their advisor. To submit your Dissertation Progress Report (DRP) log in here to submit. This site becomes available to you after your admission to candidacy. A notice will be sent asking for submission of your first annual report in April of each year. You advisor is notified upon submission, must review the report, and approve it or request more detail. After advisor approval, the DGS is notified of the report and must all review the report and provide approval.

The most important part of the Ph.D. program is research training, culminating in the writing of a dissertation. The dissertation should be concluded no later than the end of the student’s sixth year. The dissertation demonstrates the student’s ability to perform original research. Thus, it must demonstrate technical mastery of the subject and must contain conclusions that modify or enlarge what has previously been known. Because Yale is a research university dedicated to the dissemination of knowledge, all results of research, including the dissertation, must be made public. Access may not be restricted for any reason, commercial or governmental.

Thesis Defense

The student must give an oral defense of the research when his or her committee is satisfied that the work is finished, and a complete draft of the dissertation has been written. At least one week before the defense, the dissertation draft must be placed on the web, and the faculty must be notified that it is available. If the student or the advisor does not want the draft to be publicly accessible, it can be placed on the Department’s website in the “Internal CS Only” section (on the “Faculty Use Only” page.)

The defense consists of a one-hour presentation of the results followed by a 15-minute question and discussion period, both of which are open to the entire department and its guests. The committee of readers and any other faculty members who wish to participate then conduct an oral examination in closed session.

At least three readers must be present at the defense, but “presence” may be achieved technologically, e.g., by teleconference or Zoom. It is not necessary for the external reader to attend.

The defense must be scheduled by the student and advisor in consultation with the DGS and the business office, announced one month in advance, and re-announced one week in advance. The announcement must be sent by email to the entire department and must include the date, time, and location of the defense, the student’s name, the title of the dissertation, a one-paragraph abstract, and the names of the student’s advisor and committee members. At the conclusion of the defense, the student must submit a Computer Science Defense Form, signed by all committee member to document completion. The signed form should be emailed to the department registrar for filing.

Dissertation Submission

The dissertation must be submitted to the Graduate School after the thesis defense has been passed and final corrections to the dissertation draft have been made. The Graduate School requires that the dissertation be submitted by October 1 for a December degree and by March 15 for a May degree, and these deadlines are strictly enforced. Thus, the dissertation must be submitted after the student completes the defense and final corrections and on or before the Graduate School’s deadline for the degree; exactly when in this interval a particular student should submit his or her dissertation to the Graduate School depends on which term is the last in which he or she will register as a PhD student. The submission date should be determined by the student and the advisor in consultation with the DGS at
the time that the defense is scheduled. After the dissertation is submitted, copies are sent to the readers, each of whom reads the dissertation and completes a “reader’s report” form. When all readers’ reports are in, the DGS will approve the degree, so far as the department is concerned. In the unlikely event that the DGS fails to approve the degree, the subsequent course of action will be decided by the Department Chair, on a case-by-case basis. The dissertation process of submission is handled entirely online starting with the listing of readers.

**Dissertation Readers**

The dissertation must be read by a committee of four readers, which is a distinct entity from the supervisory committee (although it normally overlaps with it). Three readers must be internal (Yale University), and one must be external (another university). An internal reader may be any faculty-level person with a close affiliation to the Yale Department of Computer Science, including regular faculty, visiting faculty, research scientists, and associate research scientists. An external reader may be any qualified person who is not closely affiliated with the Computer Science Department. In addition, at least two internal readers must be regular ladder faculty in the Yale Computer Science Department. Before submitting the final dissertation to the Graduate School, be sure your readers have been submitted online here. If your advisor is one of your dissertation readers, their name must be submitted at the advisor and reader separately. Your readers will have thirty days to read and submit a report upon receipt of your dissertation.

Exceptions to these rules require approval of the DGS. For the purposes of these rules, “close affiliation” status is conferred by any extended visit in the Department or any kind of departmental appointment or title, including affiliate and adjunct titles. Occasional short-term visits or research collaborations do not constitute close affiliation. Once conferred, the status of “close affiliation” persists for a period of two years after the affiliation terminates. Thus, a Yale CS-faculty member who takes a position elsewhere may continue to serve as an internal reader for two years after leaving and may not serve as an external reader during that same period. The above notwithstanding, the reading committee must always include at least one current regular ladder faculty member in the Yale Department of Computer Science. In addition, if the advisor leaves Yale, the Graduate School may require that a current Yale faculty member serve as acting advisor.

The rules concerning the composition of the reading committee must be satisfied when the committee is first formed, at the time of the thesis defense, and at any time that the committee is changed. Enter the name of your readers to the Dissertation Reader Report system.

If you have difficulty or have any questions about submitting your degree petition and the dissertation online, please email the Dissertation Office at dissertationreaders@yale.edu or call tel:+1(203)432-0461.

**3.1.2. REQUIREMENTS**

We now describe in detail the milestones along the way to the Ph.D. The course requirements, examinations, and 690 project and report must be completed by the end of the second year. All requirements for admission to candidacy must be completed by May of the third year. The Graduate School will not allow a student to register for a fourth year of study until this step has been completed. The dissertation and defense must be completed no later than the end of the sixth year.
Milestone Requirements

690 Project

The student must submit a written report on his or her 690 project to his or her supervisory committee; the committee members grade the report, taking into account the quality of the work, the quality of the technical writing, and English proficiency. The grade and a one-page abstract must be transmitted to the DGS.

Note that the course grades for CPSC 690 and CPSC 691 are not the same as the grade on the 690 report. The advisor files a grade of “SAT” for CPSC 690 and a grade of H or HP for CPSC 691 if the student is making satisfactory progress toward completing the research and the report. If the student is not making satisfactory progress, for a grade of “UNSAT” for CPSC 690 or below HP for CPSC 691, the advisor must notify the supervisory committee and the DGS. The course grade is submitted at the end of the term, with other course grades. The grade on the 690 report is submitted after the supervisory committee has read it and agreed on a grade, which may occur before or after the course grade is submitted.

When you register for 690 and 691 please enter the name of your advisor at that time.

Qualifying Examination

The Computer Science area exam meets the requirement of the Qualified Exam set forth by the graduate school.

Thesis\(^1\) Advisor

A regular faculty member must agree to direct the student’s dissertation, thereby certifying that the student is capable of doing original research. This requirement is not automatically satisfied by the student’s receiving a grade of H or HP on his or her 690 report. The advisor may be a ladder faculty member from another Yale department if the student’s supervisory committee and the DGS approve; if the advisor’s primary appointment is not in CS, then another member of the supervisory committee whose primary appointment is in CS must serve as the student’s “advisor of record.” It is generally unproductive for a student to attempt a dissertation in an area not covered by the advisor’s interests. The thesis advisor must be chosen by the beginning of the third year.

Thesis Prospectus

A thesis prospectus must be filed with the DGS and the Graduate School by the end of the spring term of the student’s third year in the program. The prospectus is a written summary (usually about three or four pages long) of the nature and scope of the research, along with a tentative title of the dissertation. The prospectus must also include a proposed committee of readers (as defined below) and be signed by the advisor. Note that the spring term ends in May. The exact date on which the term ends in any particular year can be found on the Graduate School calendar.

By the end of the third year, the student should have satisfied all requirements for admission to candidacy, including writing a dissertation prospectus that describes the general area and direction of the dissertation

\(^{1}\) Throughout this Handbook, the words “thesis” and “dissertation” are synonyms.
research and proposes a committee of readers. Once all requirements have been satisfied, and the thesis committee has voted to admit, the admission will be approved by the DGS. In the highly unlikely event that the Dissertation Committee and the DGS are not in agreement, the subsequent course of action will be decided by the Department Chair, on a case-by-case basis.

Additional resources have been provided on the department website here. Your advisor should be aware of your plans and should be consulted on all decisions related to your progress. If there are other issues, you may consult with the DGS.

Course Requirements

Students are required to pass ten courses that, together, satisfy the following constraints:

- Two of the courses must be CPSC 690 and CPSC 691, which were mentioned in Section 3.1.1.

- CPSC 690 must be passed with a grade of SAT and CPSC 691 must be passed with a grade of HIGH PASS (HP) or HONORS (H).

- Two of the remaining courses must be passed with a grade of H; the rest must be passed with a grade of at least HP.

- In order to satisfy the program’s depth requirement, each student must pass three advanced courses in a particular field by the end of his or her second year.

CPSC 991, “Ethical Conduct of Research,” must be taken in the fall semester of the first year in the PhD program and passed with a grade of SAT.

The following rules govern which courses may be counted towards the course requirements:

General constraints:

- No course with number 499 or below can be used to satisfy a course requirement.
- Any 500-level course can be used to satisfy the 10-course requirement and the depth requirement. For example, if a theory student takes a 500-level theory course, it simultaneously counts toward both the 10-course requirement and the depth requirement.
- The CPSC 690 and CPSC 691 course sequence counts only toward the 10-course and research requirements.
- A 600-, 700-, or 800-level course may count toward the 10-course and depth requirements if it involves regular meetings with a faculty member, requires written work that can be evaluated, and results in a regular grade of H or HP. A student should check with the DGS at the time he or she registers for a 600-, 700-, or 800-level course in order to be sure that the course will count toward the 10-course and/or depth requirement. Typically, most 600-level courses do count, but 700- and 800-level courses count only with explicit DGS approval at the time of registration.
- Non-CS Department courses: A student can count a graduate-level course outside the Department towards the 10-course and depth requirements if it is relevant to the student’s program of study. The decision about whether a non-CS course satisfies a requirement is made by the DGS, possibly in consultation with the student’s advisor.
Distribution constraints:

Two of the ten courses must be in “theoretical computer science,” two must be in “programming languages and systems,” two must be in “applications,” at least one course taken at Yale must be a Computer Science course designated as "programming-intensive," with a workload whose goal is to produce several thousand lines of code at a high level of proficiency.

Theoretical Courses
557, 560, 561, 562, 563, 565, 567, 568, 569, 662, and 667.

Programming Languages and Systems
513, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 533, 534, 535, 536, 537, 538, 539, 547, 554, 559, 625, 638, 639, and 647.

Applications
510, 511, 512, 531, 532, 540, 545, 546, 547, 551, 552, 553, 558, 559, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 581, 582, 584, 679, 745, and 752.

Programming-Intensive
521, 522, 524, 526, 527, 539, 573, 578, 579, 625, and 639.

A student should check with the DGS if he or she has questions about whether a Computer Science course not mentioned in the previous two paragraphs satisfies a particular requirement.

Exceptions to these requirements and constraints may be made by the DGS.

Other constraints:

All the courses should contain substantial material beyond what the student has learned before coming to Yale. If a student is unable to find courses satisfying the requirements above, the DGS will usually accept courses from other departments that are in similar topic areas. Seminars may be acceptable, too. These are courses, usually 700-level, presented on an ad-hoc basis that may consist mainly of paper presentation and discussion. The DGS will approve such a course to satisfy the distribution requirement if a student has already studied deeply in a research area and is strongly motivated to explore it further.

3.1.3 EVALUATION OF PROGRESS

Students must maintain a satisfactory rate of progress toward the Ph.D. in order to remain in good standing in the program. During the first year, progress is measured by formal course work. To remain in good standing, courses must be completed with a grade of HP or better. When a student receives a grade of P in a course, he or she is expected to take another course (in order to have passed at least 10 courses with grades of H or HP by the end of the second year).

After the first year, progress is monitored by the student's supervisory committee. The committee looks at grade records, exam results, the 690 report, and research progress. Students beyond the first year receive written annual evaluations of their progress, drafted by the supervisory committee. Copies of evaluations are placed in the student’s file. A decision that the student is not making satisfactory progress toward the Ph.D. may be made at any time by the supervisory committee.

Students Not in Good Standing (failing to achieve required milestones or by recommendation of his or her supervisory committee)
1. The student and the faculty will be notified. All information regarding the student, including course grades, research performance, and performance on exams, will be made available to the faculty as a whole and a course of action will be determined for the student. Possibilities at this stage can include continuation in the program with revised expectations, academic probation, or dismissal from the graduate program.

2. The DGS will inform the student in writing of the faculty’s determination and, if continuation in the program is permitted, conditions that must be met in order to return to good standing will be outlined.

3. If the reason for the student’s trouble is inability to do research under the supervision of his or her current committee, a new committee can be formed and an appropriate period of time is given to the student (e.g., a term or a summer) to demonstrate ability to conduct a research project successfully. The new committee will report to the faculty at the end of this period so that a decision can be made about whether the student has returned to good standing.

4. If a supervisory committee determines that a student has not met one of his or her requirements, it should report that determination to the faculty and make a recommendation about how to proceed. A recommendation may range from termination, probation, a specific project assigned for completion under the direction of a specific faculty member or change of advisor. Subsequently, the committee should continue to monitor the student’s progress and to make recommendations to the faculty about how to proceed. A committee may recommend that the student change area of research and proceed under the direction of a new supervisory committee. This recommendation is not routine and should not be considered the normal consequence of failing an area exam.

   If the problem is corrected in a timely fashion, the committee will eventually recommend the student (having met all pre-dissertation requirements) for admittance to candidacy.

   The supervisory committee’s evaluation is particularly crucial at the end of the second year, when the results of the 690 project and area exam become available. At this time, the supervisory committee is expected to report in writing to the faculty as a whole (as well as to the student) on the student’s status. This notification should be given by the middle of May, so that a faculty meeting can be held before the end of May to act on any recommendations.

3.1.4. TEACHING ASSISTANCE AND OTHER REQUIREMENTS

In order to gain teaching experience, all graduate students are required to serve as TFs for two terms during their first three years of study. Teaching performed in order to meet the obligations of financial-aid packages can also be used to satisfy this requirement. Students who perform teaching not required for a degree or a financial-aid package may receive additional compensation—see Section 6.2.

The Graduate School requires that a Ph.D. student spend a minimum of three years in residence and that full tuition be paid for four years. If the student graduates in fewer than four years, with no leaves of absence, then any additional tuition is waived. Registered students are charged the Continuous Registration Fee (CRF) after the fourth year.

Whether a student is in good standing is independent of whether there are funds to support him or her.

If a student’s advisor leaves Yale, then what happens depends on the student’s state of progress toward
a Ph.D. A student who has not completed the three-year residency requirement and been admitted to candidacy will normally be expected to find a new advisor or go with the departing faculty member and enroll in another Ph.D. program. An advanced student normally finishes his or her dissertation while continuing under the technical supervision of the departed advisor and receives a Yale degree. In this case, the Graduate School may require that a current Yale faculty member agree to act as official advisor. Such a student will have two years to finish his or her dissertation before the Department will no longer be bound to accept it. The thesis defense must still be held at Yale, according to the usual rules.

Each student can expect to have office space in the same building as his or her advisor, subject to availability, for his or her first six years. In some cases, office space will be shared with other students. Assignments for office space is handled by the Business Office. Please contact the Manager, Administrative Support, Sue Hurlburt, susan.hurlburt@yale.edu for questions about office space.

3.1.5. THE FAST TRACK

Fast-track status enables students whose computer science education is already well under way when they enter the Ph.D. program (e.g., after receiving a master’s degree in CS from another institution) to take fewer courses and to get started sooner on research.

A student who wants to get onto the fast track must discuss the issue with the DGS upon admission to the program. The status becomes official if, by the end of the first year of study,

1. the student has taken CPSC690 (i.e., found an advisor and begun research) and
2. passed six courses with grades of HP or H. (including 691)

The DGS will examine the student’s academic history to decide which courses already taken satisfy which distribution requirements, and which requirements remain to be satisfied.

Students who expect to qualify as “fast track” may, with permission of the DGS, begin the 690 project in the first or second term of study. A student may also be granted permission to begin the 690 project in the first or second term if his or her intended area examination covers work done for the 690 project (which is now the case in programming languages and systems). Such an early start on research will not affect the eventual attainment of fast-track status; nor will it affect the number of courses that are eventually waived; both of those decisions are made by the DGS as described above.

Here in detail is the procedure that is now required to certify that a student is taking the fast track: A table must be prepared showing which Yale courses are obviated by which graduate-numbered courses at the institution where the student earned his or her M.S. All of these courses must have been taken during the student’s post-graduate education, after the award of the bachelor’s degree or equivalent. A theory course here must be paired with a theory course there, and so forth.

However, the titles of the two courses do not have to be identical, or even similar, provided that, in the judgment of the DGS, the two courses occupy the same “ecological niche.” That is, if Yale offered a course on that topic, it would be classified as a course that satisfied the same clause of the distribution requirement as the Yale course it is paired with. (Example: Suppose Yale offers a course on distributed sensor networks, and the M.S. institution offers a course on mobile computing. These can be paired, because, if Yale had a course on mobile computing, it [like the distributed sensor-networks course] would satisfy the systems requirement.)

The student must fill the course waiver form and obtain the signature of their advisor. The DGS approves
the certificate incorporating this table and sends it to the Dean of the Graduate School, who must approve waiving the courses proposed by the Department of Computer Science. No more than three courses may be waived.

3.1.6. MASTER’S DEGREES EN ROUTE TO THE PH.D.

A student in the doctoral program can earn a Master of Science (M.S.) degree and/or a Master of Philosophy (M.Phil.) degree en route to the Ph.D. The requirements for the M.S. degree are described in 3.2 below. The requirements for the Master of Philosophy (M.Phil.) degree is the same as for the Ph.D. (see Candidacy Requirements) except for requirements having to do with the dissertation. Students must submit a degree petition for the M.S. to the department registrar for approval. Degree petition deadlines are posted on the form and provided in the graduate school calendar. The M.Phil will be auto-petitioned by the university registrar after a student is admitted to candidacy.

3.2 OVERVIEW OF THE MASTER’S PROGRAM

The terminal master’s program of graduate study is normally completed in one year (i.e., two semesters.)

3.2.1 Requirements

To qualify for the Master of Science (M.S.) degree, a student must pass eight courses from an approved list of courses with a grade average of HP and with at least one grade of H. A student in the M.S. program on a visa must take a full course load of four courses per semester that count towards the M.S. requirements. A student who does not require a visa may study part time and complete the degree over a period of up to four years.

In addition to the eight required courses, a student must take CPSC 990, “Ethical Conduct of Research,” in the first semester and pass with a grade of SAT. CPSC 990 does not count towards the eight required courses for the degree and does not count towards the four courses required for full time study.

Each term each student meets with the M.S. adviser designated by the DGS to discuss the courses they plan to take. The courses approved for the M.S. degree include:

Any 500-level course in the Computer Science department.

Some 600-, 700-, or 800-level courses in the Computer Science department. A course with one of these numbers may count toward the M.S. if it involves regular meetings with a faculty member, requires written work that can be evaluated, and results in a regular grade of P, HP or H. A student must confirm with the M.S. adviser at the time they register for a 600-, 700-, or 800-level course to be sure that the course will count towards the M.S. degree. Typically, most 600-level courses do count, but 700- and 800-level courses count only with explicit approval from the M.S. adviser at the time of registration.

A few graduate courses in other departments in the Graduate School of Arts and Sciences that have significant content related to computer science and which require an intermediate level course as a prerequisite. An intermediate level course is one that requires an introductory course as prerequisite. A list of available non-computer science courses will be distributed by the M.S. adviser each semester. No more than three non-computer science courses can be counted towards the M.S. degree.

CPSC 692, a one-term independent project course, provided that the M.S. adviser approves, and a faculty member is willing to supervise the project, applying the same standards as for a Ph.D. student. The faculty is under no obligation to supervise independent projects for M.S. students.
All candidates must submit a degree petition for approval to the registrar in the term in which they expect to graduate.

3.2.2 Teaching Assistance and Other Considerations

There is no commitment to provide financial assistance to students in the terminal M.S. program. Occasionally there are teaching fellow positions available for M.S. students. For students studying full time, because of the time commitment required for teaching, such positions are generally reserved for students in their second term who have established a strong academic record at Yale. Teaching fellow positions are paid but do not cover the cost of tuition.

Students who complete the eight courses required for the M.S. in two terms may apply for an additional third term of study as a visiting student. Note that for students on a visa CPT (curricular practical training) is not available for the time between the second and third terms.

4. DEPARTMENTAL COMPUTING FACILITIES

The faculty, researchers, and students in the Department of Computer Science have access to a wide variety of ever-changing state-of-the-art computing resources, ranging from laptops, conventional PC’s, and scientific workstations to high-powered compute-servers and workstation clusters used as parallel computers. Recently, the department has created the Yale CS Cloud (http://cloud.cs.yale.edu/), which allows research groups to conduct experiments without having to fund the full equipment costs on their own. All of the computer systems are interconnected by a switched Ethernet local network, which is connected via fiber optic technology to the campus backbone and the Internet. Also installed is a wireless network permitting instant laptop access to the Internet anywhere in the building and many places on campus.

Each faculty member or Ph.D. student is equipped with a PC or laptop, running some variant of the Linux, Windows, or OSX operating systems. The computing needs of undergraduate and M.S. students are met through the “Zoo,” an educational laboratory with approximately 36 dual-processor Linux workstations that allow for remote as well as on-site access.

Individual research groups have additional specialized equipment for robotics, computer vision, computer music, networking, and other research efforts. Students in computer science, both graduate and undergraduate, have liberal access to all of these facilities. In this way, students play a vital role in contributing to our understanding of theoretical and experimental issues in computer science. The Department’s computing resources are professionally managed by Workstation Support Services (WSS), a unit of the Yale office of Information and Technology Services (ITS). WSS staff follows the policy set by a faculty oversight committee in providing first-class responsive service to all departmental users.

Poster printing capabilities are housed on the ground floor. Access to the printer is by appointment only. A request for a print job should be emailed to Alicia Vignola and copied to Sue Hurlburt. Requests should be made at least 2 business days before the poster is needed. Large files should be shared via online link if attaching to an email is not possible.

5. GRADUATE STUDENT LIFE

5.1 The McDougal Graduate Student Center

Much of the graduate student life is based in the various departments and in dormitories or apartment complexes. The new McDougal Center is a place where graduate students from across the campus
regularly meet and share interests. It is located at 135 Prospect Street, Founders Hall (203-432-2583), mcdougal.center@yale.edu.

5.1.1 Mission

A generous gift from Mr. Alfred McDougal, a Yale alumnus, and his wife, Ms. Nancy Lauter, enabled Yale to create the McDougal Graduate Student Center in 1997. The McDougal Center provides space and program funding for building intellectual, cultural, and social life, and for facilitating professional development activities across the Departments of the Graduate School of Arts and Sciences. The McDougal Center warmly welcomes the participation of students from other Yale graduate and professional schools, postdoctoral fellows, faculty, staff, and alumni of the Graduate School, and members of the larger Yale community. Its website provides all kinds of information relating to graduate student life. The McDougal Center provides members of the graduate student community with a place of their own on campus.

5.1.2 Yale University Facilities

The facilities of the McDougal Center enhance student life in many ways. The Common Room is the McDougal Center’s main space for hanging out. Whether you come for relaxation or work, the Common Room make it the perfect place to connect with Yale’s graduate community.

The McDougal Center offers lots of resources for busy grad students. The full range of resources includes:

1. Families - Spouses, Partners & Children
2. Life Skills & Personal Development
3. Health & Wellness
4. Graduate Student Organizations
5. International Student Resources

For a full listing of services, visit the website or you can reach out via email mcdougalcenter@yale.edu.

5.1.3 Student Life Programs

The McDougal Center offers a variety of activities open to the graduate and professional community. These include weekly movies on the really big screen, coffeehouse musical evenings, happy hours, poetry readings, students’ research presentations, health and wellness workshops, teas with campus and community figures, and service opportunities such as blood drives. It hosts activities organized by student groups and departments, including cultural festivals, movies, lectures, receptions, and conferences. Activities are publicized in campus publications, in McDougal notes calendar, on the website, and via email lists.

New students will have required events that will be managed by the Center. All dates and deadlines that are implemented should be followed. If you are having difficulty with your arrival time on campus, please notify your department registrar.

Additional Campus Resources

Faculty members and students are encouraged to seek assistance in improving their advising relationships and resolving any issues through a variety of Yale’s resources and offices. These include but are not limited to:
5.1.4 Office of Career Strategy (OCS)

Yale Office of Career Strategy (OCS) offers career advising, alumni connections, interview preparation, employment opportunities, and extensive career development resources. OCS works with Yale students and alumni of Yale College and Yale Graduate School of Arts and Sciences to clarify career aspirations, identify employment and educational opportunities, and offer advising and support at every stage of career development, http://ocs.yale.edu/. Occasionally, the registrar or a faculty member will receive notices about internship or employment opportunities. Those will be delivered to you via email in a timely manner.

5.1.5 THE TEACHING FELLOW PROGRAM

Requirements

Assignments for students fulfilling their required teaching assignments are given priority and must be hired in the Teaching Fellow System before any other assignments can be made. A complete guideline on the Teaching Fellow Program is available online. International students have a language requirement to pass before they can be a teaching fellow. The English Language Program (ELP) at the Center for Language Study provides a summer intensive for new PhD students. You can review that program at this link. A test will be administered at the end of the summer program. If a student does not pass, they will be required to enroll in a course as instructed by the ELP. James Tierney manages the program and can be reached directly at (203) 432-6806 or james.tierney@yale.edu.

While fulfilling language proficiency, PhD students may serve as a grader/no contact and does not hold office hours. Grader/contact assignments do not count toward the 2-term requirement of teaching. If you choose not to fulfill your teaching requirement in the first term you are eligible, please notify the
Training

The Teaching Fellow Program (TFP) provides the principal framework at Yale in which graduate students learn, under faculty guidance, to become effective teachers and to evaluate student work. Such learning is integral to the preparation of graduate students for professional lives of teaching and scholarship. In order to obtain the greatest benefit from this training, teaching fellows are urged to participate in the programs offered by the Yale Center for Teaching and Learning designed to prepare them for the variety and complexity of classroom environments that they will encounter.

5.2 Life in the Department

The Department of Computer Science at Yale is a stimulating environment in which new ideas, experimental designs, and concrete artifacts are plentiful. In trying to shape the very nature of computer science, it is not enough to ask why things are, nor to ask how things will be — but rather, to ask how things should be now and in the future. How should computers be used in our society, and why? How should we design software, algorithms, and new theories of computation? How should computer science be taught? What should the legacy of our efforts be?

The Department runs a Colloquium Series in which distinguished researchers from other universities are invited throughout the year to speak to a general computer science audience. Individual research groups also host talks for more focused audiences.

5.3 Life about Town

Yale is the focal point for much of the intellectual and cultural life of New Haven. Yale offers two symphony orchestras, a symphonic wind ensemble, a jazz ensemble, the Yale Repertory Theater, the Yale Art Gallery, the British Art Center, and more than a thousand informal concerts, recitals, and theatrical productions each year. Many of these events are presented by undergraduate members of Yale College; others are presented by the Schools of Fine Art, Drama, and Music.

Beyond the campus is a small Yankee town of 124,000. Birthplace of the cotton gin, the modern telephone exchange, and pizza, New Haven dates back to 1638. In the midst of a busy urban center, several areas of the city still retain the atmosphere of earlier days. Several clubs in the area feature jazz and rock bands. Late-night coffee houses near campus allow you to sit for hours over a cup of the best espresso south of Boston. There are many movie theaters in the area, several featuring art films, and retrospective shows.

Indeed, New Haven has a rich cultural life independent of that provided by the University. There is an excellent resident theater company, the Long Wharf Theatre, which produces plays from the standard repertoire and one or two new works each season. The historic Shubert Theater and the Palace present a wide selection of musical theater and drama. New Haven also has its own professional symphony orchestra, chamber ensembles, and a small ballet company. The town is also host of the widely acclaimed International Festival of Arts and Ideas. Every June, world-class theater, film, and dance productions, art and photography exhibits, panel discussions, and poetry readings, and many musical events turn the city into a cultural and intellectual Mecca.

New Haven boasts a wide variety of culinary establishments, from the mundane to the exotic. Available at just about any hour sandwiches and pizza, but a variety of other fare is also available at restaurants
within walking distance of the central campus: Italian, Chinese, Mexican, Japanese, Thai, Indian, Cuban, vegetarian, and vegan.

For outdoor and sports enthusiasts, there are 800 acres of beautiful trails and fields at nearby East and West Rock Parks for jogging and biking enjoyment. Yale’s famous Payne Whitney Gymnasium is open to students at no charge during the academic year and for a nominal fee in the summer. Students also have the opportunity to participate in numerous intramural sports activities during the year as well as individual sports activities such as golf, tennis, and figure skating. Sailing, rowing, and canoeing are also available at Yale facilities in nearby towns.

And of course, New Haven, Connecticut is part of New England, and is thus in proximity to all of New England’s great resources; from its quaint towns, beautiful beaches and seaports to its mountain peaks and lakes for hiking, swimming, skiing, and mountaineering. It is also easy to reach the big city experience: New Haven is only 75 miles from New York and 100 miles from Boston, and both are connected by frequent and convenient train service from Union Station. The Red Line stops at the station. Check the Yale app for a schedule.

Yale Shuttle and Safety

Yale Public Safety provides many services designed to keep the Yale community safe. There are over 500 Blue Phones on campus, and individuals may use the LiveSafe app to turn their mobile device into a safety device. The Security department provides nighttime safe rides as well as walking escort services upon request. Community members may also request Police and/or Security presence at events. Please visit the public safety website to find links to all Yale apps that are available to help you keep track of Yale Shuttle schedules, request a walking escort and other useful resources. https://your.yale.edu/community/public-safety/stay-safe-campus

6. GRADUATE ADMISSIONS AND FINANCIAL AID

6.1 Admissions Procedures

Students are admitted for entrance in the fall term only. An applicant should have strong preparation in mathematics, engineering, or science. He or she should be competent in programming but needs no computer science beyond the basic level.

Application for admission in the fall of 2022 is available August 2021. Information may be obtained from: http://www.yale.edu/graduateschool/admissions

Contact Information for the Graduate School is:

Yale University Graduate School of Arts and Sciences
Office of Graduate Admissions
302 Warner House
1 Hillhouse Avenue
New Haven, Connecticut 06511
Telephone: (203) 432-2771

Application to the Graduate School is an online process only.

Note that the Graduate School does not accept faxed copies of letters of recommendations, transcripts, or other supplemental material.
Prospective students can obtain further information by sending email to: graduate.admissions@yale.edu

For the Ph.D. application, the deadline for completed applications, including all letters of recommendation and test scores, is December 15th 2021. For the Master’s Program the deadline is January 1st 2022.

Applicants will be notified of action concerning admission as soon as the decision has been made, generally between February 1 and April 15. Those who are undergraduates at the time of admission must present evidence of having satisfactorily completed the bachelor’s degree or its equivalent in order to register in their first term. Those who are in Graduate School must present transcripts giving evidence of satisfactory completion of the current year’s work prior to registration. The Graduate School will send reminders to students admitted concerning the deadline for submittal.

There is a non-refundable application fee of $105. Applicants from countries under exchange restrictions should seek the help of their state banks or of friends already in the United States for payment of this fee.

Applicants may have the fee waived if they are members of a variety of professional organizations (NSBE, SACNAS, SWE, AISES) or have attended a qualifying conference in the past (Grace Hopper, Tapia, AfroTech). A complete list of qualifying organizations and conferences, as well as the fee waiver form, can be found here.

Master’s program applicants should arrange to take the GRE no later than October testing. The doctoral program no longer requires the GRE. The results of later testing are usually not available before admissions decisions are made. Remember that ETS will report scores only by mail and only at the written request of the student. Address inquiries to:

GRE-ETS, P.O. Box 6000, Princeton, NJ 08541-7670

Except by prearrangement with the Dean’s office, foreign applicants whose native language is not English must present evidence of proficiency in English by satisfactorily completing the Test of English as a Foreign Language, administered in foreign countries by the Educational Testing Service. TOEFL scores must be received by December 15th. Address inquiries to:

TOEFL/TSE Services - ETS GRE-ETS
P.O. Box 6000
Princeton, NJ 08541-7670
609-771-7650
www.ets.org | www.toefl.org
6.2 Financial Aid Policy

The department will provide financial support for at least the first five years of study.

After the first year, students often receive research assistantships in their field of specialization or other forms of support. These may also be supplemented by teaching fellowships. The standard teaching fellowship in this department is at the level of a Teaching Fellow 2 and requires approximately 10 hours of work per week. Advanced students are sometimes supported through a combination of a university fellowship and a teaching fellowship.

Advisors will make every effort to provide financial support after the fifth year. In cases where support is not available, PhD. students are encouraged to explore paid teaching opportunities. Note that a nominal “Continuous Registration Fee” (currently $650.00 per term) replaces the tuition requirement after the fourth year. (See the Graduate School “Programs and Policies” book for more information on the tuition policy.)

Students fulfilling their teaching requirements will be paid the standard stipend amounts in the terms up to and including the terms they are a teaching fellow. Afterwards, students may continue to assist in courses as a teaching fellow if they are hired by faculty. The teaching fellow stipend is paid in addition to student support.

Stipend payments are made bi-monthly on the 15th and 30th of each month. If there are any irregularities with your paycheck, you should contact Payroll Services for assistance at employee.services@yale.edu. In order to receive payments, you must be enrolled full-time as a student. It is your responsibility to maintain an active status. Please ensure that your banking information is up to date for direct deposit purposes.

7. GRADUATE COURSES

Prerequisites are not listed. If you are not sure that your background is adequate, please speak to the instructor.

CPSC 510a The Law and Technology of Cyber Conflict
Not offered 2021-2022 Academic Year
A cross-disciplinary seminar that addresses both technical and legal aspects of cyber conflict. Recent events, including the hacks of Sony and the U.S. Office of Personnel Management, illustrate the need for new thinking about the particular issues raised when cyber-attacks originate from state or quasi-state actors. Professors from Yale Law School and the Computer Science Department will lead in-depth explorations of cyber conflict from both legal and technical points of view. Enrollment is limited to ten Yale Law School students and ten students from Yale College or GSAS. This is the first half of a yearlong course; the second half is CPSC 511b. Students are required to make a yearlong, two-term commitment.

CPSC 511b The Law and Technology of Cyber Conflict: Practicum
Not offered 2021-2022 Academic Year
A cross-disciplinary practicum that addresses both technical and legal aspects of cyber conflict. Recent events, including the hacks of Sony and the U.S. Office of Personnel Management, illustrate the need for new thinking about the particular issues raised when cyber-attacks originate from state or quasi–state actors. Professors from Yale Law School and the Computer Science Department will oversee intensive student projects on both legal and technical aspects of cyber conflict. Enrollment is limited to ten Yale Law School students and ten students from Yale College or GSAS. This is the second half of a yearlong course; the first half is CPSC 510a. Students are required to make a yearlong, two-term commitment.
CPSC 512a *Designing the Digital Economy*  
Not offered 2021-2022 Academic Year  
Digitization is transforming a variety of markets from personal transportation services to advertising. This course explores the economic tools (market design, price theory, causal inference, etc.) and technical tools from computer science (machine learning, the analysis of algorithms, user interface design, etc.) students need to contribute meaningfully to this transformation. Prerequisites: elementary training in both economics and computer science and some intermediate/advanced training in at least one relevant field.

CPSC 513a *Computer Systems Security*  
MW 1:00-2:15  
Timothy Barron  
Overview of the principles and practice behind analyzing, designing, and implementing secure computer systems. The course covers problems that have continued to plague computer systems for years as well as recent events and research in this rapidly evolving field. Students learn to think from the perspective of an adversary, to understand systems well enough to see how their flaws could be exploited, and to consequently defend against such exploitation. The course offers opportunities for hands-on exploration of attacks and defenses in the contexts of web applications, networks, and system-level software. It also addresses ethical considerations and responsibilities associated with security research and practice.

CPSC 521b *Compilers and Interpreters*  
TTh 1:00-2:15  
Jay Lim  
Compiler organization and implementation: lexical analysis, formal syntax specification, parsing techniques, execution environment, storage management, code generation and optimization, procedure linkage, and address binding. The effect of language-design decisions on compiler construction.

CPSC 522a *Design and Implementation of Operating Systems*  
MW 2:30-3:45  
Zhong Shao  
The design and implementation of operating systems. Topics include synchronization, deadlock, process management, storage management, file systems, security, protection, and networking.

CPSC 523b *Principles of Operating Systems*  
TTh 9:00-10:15  
Avi Silberschatz  
A survey of the underlying principles of modern operating systems. Topics include process management, memory management, storage management, protection and security, distributed systems, and virtual machines. Emphasis on fundamental concepts rather than implementation.

CPSC 524a *Parallel Programming Techniques*  
Not offered 2021-2022 Academic Year  
Practical introduction to parallel programming, emphasizing techniques and algorithms suitable for scientific and engineering computations. Aspects of processor and machine architecture. Techniques such as multithreading, message passing, and data parallel computing using graphics processing units. Performance measurement, tuning, and debugging of parallel programs. Parallel file systems and I/O.

CPSC 525b *Cloud Networking and Computing*  
MW 2:30-3:45  
Lin Zhong  
Study of critical technology trends and new challenges in cloud and data center designs for different trade-offs of performance, scalability, manageability, and cost in the networking layers and big data analytical frameworks. Consideration of cloud infrastructure, including network topology, network traffic management, network management, transport protocols, programmable switches, network functions, virtualization, network reliability, and security.
An exploration of the challenges and techniques for building decentralized computing systems, in which many networked computers need to cooperate reliably despite failures and without assuming centralized management. Topics include decentralized storage systems, mobile and remote execution, hosting untrusted code, [byzantine] fault tolerance, naming, capabilities, information flow control, distributed shared memory, distributed hash tables, content distribution, and practical uses of cryptography.

Object-oriented programming as a means to efficient, reliable, modular, reusable code. Use of classes, derivation, templates, name-hiding, exceptions, polymorphic functions, and other features of C++.

Basic design and implementation of language-based approaches for increasing the security and reliability of systems software. Topics include proof-carrying code; certifying compilation; typed assembly languages; runtime checking and monitoring; high-confidence embedded systems and drivers; and language support for verification of safety and liveness properties.

Humans are stupid; computers are limited. Yet a collaboration of humans and computers has led to ever more powerful and complex computer systems. This course examines the limitations of humans and computers in this endeavor and how they shape the design, implementation, and evaluation of computer systems. It surveys the empirical knowledge reported by scholars and practitioners who overcome such limitations.

Introduction to formal approaches to programming language design and implementation. Topics include the lambda-calculus, type theory, denotational semantics, type-directed compilation, higher-order modules, and application of formal methods to systems software and Internet programming.

Study of the theoretical and practical fundamentals of computer-generated music, with a focus on high-level representations of music, algorithmic and heuristic composition, and programming languages for computer music generation. Theoretical concepts are supplemented with pragmatic issues expressed in a high-level programming language.

Study of the theoretical and practical fundamentals of computer-generated music, with a focus on low-level sound representation, acoustics and sound synthesis, scales and tuning systems, and programming languages for computer music generation. Theoretical concepts are supplemented with pragmatic issues expressed in a high-level programming language.

An introduction to the design, implementation, analysis, and evaluation of computer networks and their
protocols. Topics include layered network architectures, applications, transport, congestion, routing, data link protocols, local area networks, performance analysis, multimedia networking, network security, and network management. Emphasis on protocols used on the Internet.

CPSC 534a *Topics in Networked Systems*  
**TTh 2:30-3:45**  
Richard Yang  
Networked systems such as the Internet and mobile networks provide the major infrastructure components of our information-based society. This course covers the design principles, implementation, and practical evaluation of such systems in new settings, including cloud computing, software-defined networking, 5G, Internet of things, and vehicular networking. The final project involves the design, implementation, and evaluation of a new networked system.

CPSC 535 *Internet-scale Applications*  
Not offered 2021-2022 Academic Year  
An introduction to the design and implementation of Internet-scale applications and services. Topics include service-oriented software design; cloud computing paradigms; infrastructure scalability and reliability; adaptive, open clients; protocol specification; performance modeling; debugging and diagnosis; and deployment and licensing.

CPSC 536 *The Hardware/Software Interface*  
Not offered 2021-2022 Academic Year  
Interactions of computer architecture and systems software for high-performance systems. In particular, the focus is on advanced aspects of compilation, particularly program analysis, code generation, optimization (i.e., the back end of modern compilers). No prior exposure to compilers is assumed, but the front end (i.e., lexing, parsing, etc.) is covered only briefly, in as much as is needed for studying compilation back end. Hands-on exposure to programming projects using LLVM.

CPSC 537a *Introduction to Databases*  
**TTh 9:00-10:15**  
Abraham Silberschatz  

CPSC 538a *Database System Implementation and Architectures*  
**MW 4:00 - 5:15**  
Anurag Khandelwal  
A study of systems programming techniques, with a focus on database systems. Half the course is spent studying the design of a traditional DBMS, supplemented by a hands-on exercise where students build various components (e.g., a catalog-manager, a buffer-manager, and a query execution engine) of a DBMS prototype. The other half is spent on non-traditional architectures (parallel databases, data warehouses, stream databases, Web databases).

CPSC 539b *Software Engineering*  
**MW 11:35-12:50**  
Antonopoulos Timos  
Introduction to building a large software system in a team. Learning how to collect requirements and write a specification. Project planning and system design. Increasing software reliability: debugging, automatic test generation. Introduction to type systems, static analysis and model checking.

CPSC 540 *Numerical Computation*  
Not offered 2021-2022 Academic Year  
Algorithms for numerical problems in the physical, biological, and social sciences: solution of linear and nonlinear systems of equations, interpolation and approximation of functions, numerical differentiation
and integration, optimization.

CPSC 545 *Introduction to Data Mining*  
Not offered 2021-2022 Academic Year  
A study of algorithms and systems that allow computers to find patterns and regularities in databases, to perform prediction and forecasting, and to improve their performance generally through interaction with data.

CPSC 546b *Data and Information Visualization*  
MW 9:00-10:15  Holly Rushmeier  
Visualization is a powerful tool for understanding data and concepts. This course provides an introduction to the concepts needed to build new visualization systems, rather than to use existing visualization software. Major topics are abstracting visualization tasks, using visual channels, spatial arrangements of data, navigation in visualization systems, using multiple views, and filtering and aggregating data. Case studies to be considered include a wide range of visualization types and applications in humanities, engineering, science, and social science.

CPSC 547b TBA

CPSC 549b *Computer Architecture and Artificial Intelligence*  
TTh 1:30-3:20  Richard Lethin  
Introduction to the development of computer architectures specialized for cognitive processing, both offline “thinking machines” as well as embedded devices. History of machines starting with early conceptions in defense systems to contemporary initiatives. Instruction sets, memory systems, parallel processing, analog architectures, probabilistic architectures, graph computing architectures, machine-learning architectures. Application and algorithm characteristics.

CPSC 551b *The User Interface*  
TTh 9:00-10:15  David Gelernter  
The user interface (UI) in the context of modern design, where tech has been a strong and consistent influence from the Bauhaus and U.S. industrial design of the 1920s and 1930s through the IBM-Eames design project of the 1950s to 1970s. The UI in the context of the windows-menus-mouse desktop, as developed by Alan Kay and Xerox in the 1970s and refined by Apple in the early 1980s. Students develop a detailed design and simple implementation for a UI.

CPSC 552b *Unsupervised Learning*  
TTh 11:35-12:50  Smita Krishnaswamy  
Deep neural networks have gained immense popularity within the last decade due to their success in many important machine learning tasks such as image recognition, speech recognition, and natural language processing. This course will provide theoretical background as well as practical understanding of design and training of neural networks. By the end of the course, students will have mastered the principles underlying neural networks including optimization and training methods, design and architecture, generalization theory, loss landscapes, and will have applied deep learning methods to real-world problems including image recognition, natural language processing, and biomedical applications.

CPSC 553a *Unsupervised Learning for Big Data*  
TTh 11:35-12:50  Smita Krishnaswamy  
This course covers machine-learning methods well-suited to tackling problems associated with analyzing high-dimensional, high-throughput noisy data including: nonlinear dimensionality reduction, kernels and data graphs, graph signal processing, clustering and coarse graining, information theoretic analysis,
neural network embeddings. The course will involve both theory and practical implementations of algorithm in python and pytorch.

CPSC 554b **Software Analysis and Verification**  
TTh 2:30-3:45  
Ruzica Piskac  
Introduction to concepts, tools, and techniques used in the formal verification of software. State-of-the art tools used for program verification; detailed insights into algorithms and paradigms on which those tools are based, including model checking, abstract interpretation, decision procedures, and SMT solvers.

CPSC 555 **Economics and Computation**  
Not offered 2021-2022 Academic Year  
A mathematically rigorous investigation of the interplay of economic theory and computer science, with an emphasis on the relationship of incentive-compatibility and algorithmic efficiency. Particular attention to the formulation and solution of mechanism-design problems that are relevant to data networking and Internet-based commerce.

CPSC 556 **Wireless Technologies**  
Not offered 2021-2022 Academic Year  
Fundamental theory of wireless communications and its application explored against the backdrop of everyday wireless technologies such as Wi-Fi and cellular networks. Channel fading, MIMO communication, space-time coding, opportunistic communication, OFDM and CDMA, and the evolution and improvement of technologies over time. Emphasis on the interplay between concepts and their implementation in real systems. The labs and homework assignments require Linux and MATLAB skills and simple statistical and matrix analysis (using built-in MATLAB functions).

CPSC 557a **Sensitive Information in a Connected World**  
MW 2:30 - 3:45  
Michael Fischer  
Issues of ownership, control, privacy, and accuracy of the huge amount of sensitive information about people and organizations that is collected, stored, and used by today's ubiquitous information systems. Readings consist of research papers that explore both the power and the limitations of existing privacy-enhancing technologies such as encryption and "trusted platforms."

CPSC 558b **Automated Decision Systems**  
TTh 4:00 - 5:15  
Stephen Slade  
People make dozens of decisions every day in their personal and professional lives. What would it mean for you to trust a computer to make those decisions for you? It is likely that many of those decisions are already informed, mediated, or even made by computer systems. Explicit examples include dating sites like match.com or recommendation systems such as amazon or Netflix. Most Internet ads on sites like Google or Facebook are run by real-time bidding (RTB) systems that conduct split second auctions in the hopes of getting your attention. Driverless cars offer the promise of safer highways. Corporations and other enterprises invest in decision support systems to improve the quality of their products and services. This course considers the spectrum of automated decision models and tools, examining their costs and effectiveness. Examples will come from a variety of fields including finance, risk management, credit-card fraud, robotics, medicine, and politics.

CPSC 559a **Building Interactive Machines**  
TTh 1:00-2:15  
Marynel Vázquez  
This advanced course brings together methods from machine learning, computer vision, robotics, and human-computer interaction to enable interactive machines to perceive and act in a variety of environments. Part of the course examines approaches for perception with different sensing devices and algorithms; the other part focuses on methods for decision-making and applied machine learning for
control. The course is a combination of lectures, state-of-the-art reading, presentations and discussions, programming assignments, and a final team project.

CPSC 560a Automata Theory and Formal Languages
MW 11:35-12:50 Andrew Bridy
Introduction to the theory of automata and formal languages, one of the building blocks of theoretical computer science. Major topics covered are finite automata, pushdown automata, and Turing machines, and their associated languages.

CPSC 561 Foundations of Cryptography
Not offered 2021-2022 Academic Year
Foundations of modern cryptography and their application to computer and network security. Topics include randomized models of computation, indistinguishability, computationally hard problems, one-way and trapdoor functions, pseudorandom generators, zero-knowledge, secure computation, and probabilistic proofs.

CPSC 562 Spectral Graph Theory
Not offered 2021-2022 Academic Year
An introduction to spectral graph theory motivated by computer science, covering advanced topics in linear algebra and exploring the combinatorial meaning of the eigenvalues and eigenvectors of matrices associated with graphs. Applications to optimization, numerical linear algebra, error-correcting codes, pseudorandomness, and the discovery of graph structure.

CPSC 563a Algorithm via Continuous Optimization
T 9:25-11:15 Nisheeth Vishnoi
Continuous optimization has played a major role in the recent development of fast algorithms for problems arising in areas such as theoretical computer science, discrete optimization, and machine learning. The approach is to first formulate the problem as a continuous optimization problem, even if the problem may be over a discrete domain, adapt or develop deterministic or randomized continuous-time dynamical systems to solve it, and then design algorithms for the problem via appropriate discretization. The goal of this course is to design state-of-the-art algorithms for various classical discrete problems through the use of continuous optimization/sampling. The algorithmic applications include shortest paths, bipartite matching, flows, linear programming, sampling, and counting. We present approaches including gradient descent, mirror descent, multiplicative weights update method, accelerated gradient descent, Riemannian descent, Newton’s method, cutting-plane methods, Langevin dynamics, and Hamiltonian dynamics.

CPSC 565 Theory of Distributed Systems
Not offered 2021-2022 Academic Year
Models of asynchronous distributed computing systems. Fundamental concepts of concurrency and synchronization, reliability, topological and geometric constraints, time and space complexity, and distributed algorithms.

CPSC 567b Cryptography and Computer Security
MW 2:30-3:45 Charalampos Papamanthou
A survey of such private and public key cryptographic techniques as DES, RSA, and zero-knowledge proofs, and their application to problems of maintaining privacy and security in computer networks. Focus on technology, with consideration of such societal issues as balancing individual privacy concerns against the needs of law enforcement, vulnerability of societal institutions to electronic attack, export regulations and international competitiveness, and development of secure information systems.
CPSC 568a Computational Complexity
   Not offered 2021-2022 Academic Year
Introduction to the theory of computational complexity. Basic complexity classes, including Polynomial Time, Nondeterministic Polynomial Time, Probabilistic Polynomial Time, Polynomial Space, Logarithmic Space, and Nondeterministic Logarithmic Space. The roles of reductions, completeness, randomness, and interaction in the formal study of computation.

CPSC 569 Randomized Algorithms
   Not offered 2021-2022 Academic Year
Beginning with an introduction to tools from probability theory including some inequalities like Chernoff bounds, the course will cover randomized algorithms from several areas: graph algorithms, algorithms in algebra, approximate counting, probabilistically checkable proofs, and matrix algorithms.

CPSC 570b Artificial Intelligence
   MWF 10:30-11:20  Brian Scassellati
An introduction to artificial intelligence research, focusing on reasoning and perception. Topics include knowledge representation, predicate calculus, temporal reasoning, vision, robotics, planning, and learning.

CPSC 571 Topics in Artificial Intelligence
   Not offered 2021-2022 Academic Year
An in-depth study of one area of artificial intelligence. Possible topics include automated planning, scheduling with explicitly represented objective functions, AI and philosophy of the mind, computational approaches to stereo vision, multiagent systems, and automated diagnosis using functional models. After CPSC 570a or with permission of instructor.

CPSC 572a Intelligent Robotics
   MWF 10:30-11:20  Brian Scassellati
Introduction to the construction of intelligent, autonomous systems. Sensory-motor coordination and task-based perception. Implementation techniques for behavior selection and arbitration, including behavior-based design, evolutionary design, dynamical systems, and hybrid deliberative-reactive systems. Situated learning and adaptive behavior.

CPSC 573 Intelligent Robotics Laboratory
   Not offered 2021-2022 Academic Year
Students work in small teams to construct novel research projects using one of a variety of robot architectures. Project topics may include human-robot interaction, adaptive intelligent behavior, active perception, humanoid robotics, and socially assistive robotics.

CPSC 574a Computational Intelligence for Games
   TTh 11:35-12:50  James Glenn
Introduction to techniques used for creating computer players for games, particularly board games. Topics include combinatorial and classical game theory, stochastic search methods, applications of neural networks, and procedural content generation.

CPSC 575a Computational Vision and Biological Perception
   MW 2:30-3:45  Steven Zucker
An overview of computational vision with a biological emphasis. Suitable as an introduction to biological perception for computer science and engineering students, as well as an introduction to computational vision for mathematics, psychology, and physiology students.
CPSC 576b Advanced Computational Vision  
MW 2:30-3:45  
Steven Zucker  
Advanced view of vision from a mathematical, computational, and neurophysiological perspective. Emphasis on differential geometry, machine learning, visual psychophysics, and advanced neurophysiology. Topics include perceptual organization, shading, color and texture analysis, and shape description and representation.

CPSC 577b Natural Language Processing  
TTh 1:00-2:15  
Dragomir Radev  
Linguistic, mathematical, and computational fundamentals of natural language processing (NLP). Topics include part of speech tagging, Hidden Markov models, syntax and parsing, lexical semantics, compositional semantics, machine translation, text classification, discourse, and dialogue processing. Additional topics such as sentiment analysis, text generation, and deep learning for NLP.

CPSC 578b Computer Graphics  
MW 11:35-12:50  
Julie Dorsey  
An introduction to the basic concepts of two- and three-dimensional computer graphics. Topics include affine and projective transformations, clipping and windowing, visual perception, scene modeling and animation, algorithms for visible surface determination, reflection models, illumination algorithms, and color theory. Assumes solid C or C++ programming skills and a basic knowledge of calculus and linear algebra.

CPSC 579a Advanced Topics in Computer Graphics  
T 9:25-11:25  
Julie Dorsey  
An in-depth study of advanced algorithms and systems for rendering, modeling, and animation in computer graphics. Topics vary and may include reflectance modeling, global illumination, subdivision surfaces, NURBS, physically based fluids systems, and character animation.

CPSC 581a Introduction to Machine Learning  
TTh 2:30-3:45  
Andre Wibisono  
This course provides an introduction to machine learning and the problem of learning from data. In this course we will study some fundamental frameworks for formulating learning tasks as computational problems and explore algorithms for solving them. Topics focus on supervised learning, including empirical risk minimization, classification, regression; nonlinear features, kernel methods, neural networks; learning theory, generalization, stability; Bayesian methods, approximate inference, sampling, variational inference; and some modern machine learning phenomena such as overparameterization. This course provides a foundation for students interested in taking further classes or doing research in machine learning. This course is designed for advanced undergraduates and beginning graduate students. Mathematical maturity and knowledge of calculus, linear algebra, and probability are recommended.

CPSC 582b Current Topics in Applied Machine Learning  
MW 1:00-2:15  
David Van Dijk  
CPSC 610a Computer Science and Law  
W 3:30-5:20  
Joan Feigenbaum  
This course focuses on socio-technical problems in computing, i.e., problems that cannot be solved through technological progress alone but rather require legal, political, or cultural progress as well. Examples include but are not limited to computer security, intellectual property protection, cyber-crime, cyber war, surveillance, and online privacy. The course is addressed to graduate students in Computer Science who are interested in socio-technical issues but whose undergraduate work may not have
addressed them; it is designed to bring these students rapidly to the point at which they can do research on socio-technical problems. Students do term projects (either papers or software artifacts) and present them at the end of the term.

CPSC 625 Advanced Cloud Computing Systems
Not offered 2021-2022 Academic Year
This course will focus on the fundamental systems research that enabled and continues to power modern cloud computing. We will cover the production systems that run within data centers operated by large cloud companies such as Google, Microsoft and Amazon, as well as the ground-breaking academic research that paved the way for these systems. Technically, we'll focus on the abstractions and mechanisms required to build online services that are scalable, highly available, durable, and consistent. We'll cover the entire stack, ranging from single-machine systems to protocols for distributing and replicating data within and across data centers. By the end of the course, students should be able to critically read a systems paper; distill, apply and improve upon key ideas from it; and write a short paper describing their own systems project.

CPSC 634 Building an Internet Router
Not offered 2021-2022 Academic Year
This course combines seminar-style readings and discussions with practical, hands-on development of a term-long project. Students read a selection of papers to get both a historical perspective and exposure to current research in networking. Students write reviews of the papers to make sure everyone keeps up with the readings and to develop their (technical) communication skills. Throughout the term, students work in teams to develop a fully functional IP router. Students design the control plane in Python on a Linux host and design the data plane in the new P4 language. Teams must demonstrate that their routers can interoperate with those of the other teams by building a small topology utilizing everyone’s router.

CPSC 638 Database Architectures
Not offered 2021-2022 Academic Year
This course focuses on modern database architectures. Although the traditional database architecture (centralized, relational, disk-resident, ACID) has been very successful and continues to be in widespread use, new applications and technologies have led to a wide variety of nontraditional architectures in commercial and open-source projects as well as academia. This course examines why these new architectures have developed and explores aspects of their novel features.

CPSC 639 Cloud-Scale Software Engineering
Not offered 2021-2022 Academic Year
This course teaches students engineering methodology, design, and implementation skills that are needed for developing software systems that may span a range of scales, from desktop/mobile applications to Cloud-level distributed systems. The course begins by covering software engineering foundations including the software lifecycle, software engineering models such as extreme programming and agile development, design patterns, modularity/reusability, version control, multi-threaded design, sockets, and file I/O. The latter portion of the course extends these foundations by focusing on software scalability and reliability. To this end, we examine distributed Cloud platforms and cover Cloud-specific concepts such as MapReduce, key-value stores, and log-based platforms.

CPSC 640b Topics in Numerical Computation
MW 2:30-3:45 Vladimir Rokhlin
This course discusses several areas of numerical computing that often cause difficulties to non-numericists, from the ever-present issue of condition numbers and ill-posedness to the algorithms of numerical linear algebra to the reliability of numerical software. The course also provides a brief
introduction to "fast" algorithms and their interactions with modern hardware environments. The course is addressed to Computer Science graduate students who do not necessarily specialize in numerical computation; it assumes the understanding of calculus and linear algebra and familiarity with (or willingness to learn) either C or FORTRAN. Its purpose is to prepare students for using elementary numerical techniques when and if the need arises.

CPSC 647a Quantum Computer Systems
MW 1:00-2:15 Yongshan Ding
This course explores advanced topics in quantum computer systems design. We spend some time developing the mathematical basis of quantum computation and information, then examine powerful techniques in quantum application and architecture design. Students learn to work with IBM Qiskit software tools to write quantum programs and execute them on cloud-accessible quantum hardware. Topics covered include quantum programming, quantum algorithms, quantum compilation, memory management, quantum error correction, and some research topics.

CPSC 659a Building Interactive Machines
Not offered 2021-2022 Academic Year
This course brings together methods from machine learning, computer vision, robotics, and human-computer interaction to enable interactive machines to perceive and act in dynamic environments. Part of the course examines approaches for perception with a variety of devices and algorithms; the other part focuses on methods for decision-making. The course is a combination of lectures, reviews of state-of-the-art papers, discussions, coding homework, and a final team project.

CPSC 662a Spectral Graph Theory
Not offered 2021-2022 Academic Year
An applied approach to spectral graph theory. The combinatorial meaning of the eigenvalues and eigenvectors of matrices associated with graphs. Applications to optimization, numerical linear algebra, error-correcting codes, computational biology, and the discovery of graph structure.

CPSC 663b Deep Learning Theory and Applications
Not offered 2021-2022 Academic Year
Deep neural networks have gained immense popularity in the past decade due to their outstanding success in many important machine-learning tasks such as image recognition, speech recognition, and natural language processing. This course provides a principled and hands-on approach to deep learning with neural networks. Students master the principles and practices underlying neural networks, including modern methods of deep learning, and apply deep learning methods to real-world problems including image recognition, natural language processing, and biomedical applications. Course work includes homework and a final project—either group or individual, depending on the total number enrolled—with both a written and oral (i.e., presentation) component.

CPSC 667 Advanced Cryptography and Security
Not offered 2021-2022 Academic Year
Recent developments in cryptography. Topics include secure multiparty computation, verifiable computation, cryptographic obfuscation, functional encryption, and more. We study the motivation for, applications of, and security requirements for each of these primitives. We then focus on a few different constructions that instantiate each primitive and the formal proofs of security for them. Another point of consideration is the efficiency properties for the constructions, both asymptotically and in concrete practical terms when implementations are available.
This term's topic is Artificial General Intelligence, or AGI. After 50 years, AI has scored some impressive successes, but has not yet produced a satisfying “artificial person,” that is, an entity that possesses a person’s ability to cope with many different situations, including linguistic discourse. Some people think this is because the field has made wrong turns toward overly specialized research. They have created a series of conferences on AGI to address the need for research that keeps its eyes on the long-term prize—the artificial person. To investigate all this, the course will be oriented around research papers in both the AGI subfield and its completion, “narrow AI” work on robotics, question answering, and such. Students will have opportunities to present and of course, discuss these papers.

**CPSC 674b Advanced Computational Intelligence for Games**
TTh 11:35-12:50 James Glenn
A seminar on current topics in computational intelligence for games, including developing agents for playing games, procedural content generation, and player modeling. Students read, present, and discuss recent papers and competitions, and complete a term-long project that applies some of the techniques discussed during the term to a game of their choice.

**CPSC 677a Advanced Natural Language Processing**
TTh 1:00 - 2:15 Dragomir Radev
Advanced topics in natural language processing (NLP), including related topics such as deep learning and information retrieval. Included are: (1) fundamental material not covered in the introductory NLP class such as text summarization, question answering, document indexing and retrieval, query expansion, graph-based techniques for NLP and IR, as well as (2) state-of-the-art material published in the past few years such as transfer learning, generative adversarial networks, reinforcement learning for NLP, sentence representations, capsule networks, multitask learning, and zero-shot learning.

**CPSC 679b Movie & Game Physics Simulation**
TTh 1:00 - 2:15 Theodore Kim
This course covers computational methods that commonly arise when simulating physics in movies, games, and computational fabrication. In particular, we learn state-of-the-art methods for simulating fluids (fire and water) and solids (muscles, clothing, and skin). The algorithms discussed span offline techniques suitable for movies and fabrication, as well as real-time techniques for games. We cover finite difference and finite element representations as well as solver practicalities such as conjugate gradients, preconditioning, and Newton iteration.

**CPSC 690a or b Independent Project: By arrangement with Faculty**
Individual research for students in the PhD program. Requires a faculty supervisor and the permission of the Director of Graduate Studies.

**CPSC 691a or b Independent Project: By arrangement with Faculty**
Continuation of CPSC 690b or a.

**CPSC 692a or b Independent Project: By arrangement with Faculty**
Individual research for students in the MS program. Requires a faculty supervisor and the permission of the Director of Graduate Studies.

**CPSC 745 Advanced Topics in Machine Learning and Data Mining**
Not offered 2021-2022 Academic Year
An overview of advances in the past decade in machine learning and automatic data-mining approaches for dealing with the broad scope of modern data-analysis challenges, including deep learning, kernel
methods, dictionary learning, and bag of words/features. This year, the focus is on a broad scope of biomedical data-analysis tasks, such as single-cell RNA sequencing, single-cell signaling and proteomic analysis, health care assessment, and medical diagnosis and treatment recommendations. The seminar is based on student presentations and discussions of recent prominent publications from leading journals and conferences in the field.

CPSC 752b Bioinformatics: Practical Application of Simulation & Data Mining
     MW 1:00-2:15  Mark Gerstein
Bioinformatics encompasses the analysis of gene sequences, macromolecular structures, and functional genomics data on a large scale. It represents a major practical application for modern techniques in data mining and simulation. Specific topics to be covered include sequence alignment, large-scale processing, next-generation sequencing data, comparative genomics, phylogenetics, biological database design, geometric analysis of protein structure, molecular-dynamics simulation, biological networks, normalization of microarray data, mining of functional genomics data sets, and machine learning approaches for data integration.

CPSC 800a or b Directed Readings: By arrangement with Faculty
CPSC 990a and 991a Ethical Conduct of Research.
     F 1:30-3:20  Holly Rushmeier

7.1 Registration and Other deadlines

Student must maintain full-time enrollment status each term. The advisor and/or the DGS should be consulted when creating a schedule of courses that aligns with your area of study. Registration deadlines are sent to students from the University Registrar each term. This site was set up to provide resources for registration:

https://gsas.yale.edu/academic-requirements/registration-courses
You should review all emails coming from the graduate deans, the university registrar, and the provost throughout the year. It is your responsibility to stay abreast of important guidelines, trainings, and deadlines concerning graduation. An academic calendar for the graduate school (not be confused with Yale College) can be found here.

After meeting all course requirements Ph.D. students should enroll in the following courses to maintain full-time status:

QUAL999 you must pass qualifying exam; have not submitted your dissertation prospectus
CAND999 you have passed your qualifying exam and working on your dissertation prospectus
DISR999 you have been admitted to candidacy

8. GRADUATE SCHOOL CALENDAR

Academic dates and deadlines are subject to change. Please refer to the online calendar for up-to-date information. Go to http://gsas.yale.edu, click on “Calendar” in the upper right, and then click on “View Academic Calendar” in the upper left.

Helpful Links and Reminders

**Milestones in the Ph.D. program are as follows:**

☐ Writing a paper on the subject of the first year of research-called the “690 paper” because the first year is classified as a course with this number (~by end of 2nd year)

☐ passing a qualifying exam administered by the supervisory committee, which tests mastery of the general subject area and context of the student’s research interests (~by end of 3rd year)

☐ Submitting a dissertation prospectus and being admitted to candidacy (~by end of 3rd year)
  ☐ Require three readers (2 internal to CS, 1 external)
  ☐ Each reader and the advisor grade the prospectus
  ☐ Advisor sends prospectus to the DGS with final grade
  ☐ A copy must be sent to the department registrar for submittal to the University Registrar

Your admission to candidacy is filed using this form: Admission to Candidacy Certification

**Starting in the third year the main focus is on research**, guided by an advisor and supervisory committee.

**Dissertation Defense**

The formal dissertation defense has two phases:

1. A public talk that all members of the department are encouraged to attend. Student must give faculty a 30-day notice, followed by a one-week notice. At the end of this phase a Computer Science Defense form should be filled and signed.
   a. Bring or email a finalized (Pass or Fail) copy to the departmental registrar.
2. Dissertation completion.
   a. Copy is submitted to the Dissertation Office.
   b. Readers are notified (and have 30 days to submit a report).
c. A copy must also be submitted to the department registrar.

A Dissertation Checklist is available online here. You are responsible for ensuring copies of all reports that are approved are submitted to the Registrar’s Office for your student file.

In order to maintain full-time status, do not submit your dissertation until after the last day of registration in any term. Doing otherwise will disqualify you from receiving student support. All of this is subject to approval from your advisor and the DGS.

GRADUATION

Yale has centralized information concerning graduation each year. There is no ceremony in December for 2021. Students who are expected to graduate will receive an email from the Graduate Registrar’s office to RSVP and confirm the name that should appear on the diploma.

Diplomas are mailed to your address on record. Make sure your information is up to date and accurate.

Summer Study/Internships

During your time as a doctoral student, you are allowed to participate in two summer internships. These internships are subject to approval by the Dean of Graduate Studies. When you have secured an offer, you must submit a Summer Internship Form. A report is due at the conclusion of the internship and sent to the Administrative Dean of the Graduate School by October 1st.

Other forms can be found online that address other matters like course drop, leave of absence or degree petition. Students are responsible for ensuring that forms due to the University Registrar are given to the departmental registrar well in advance of any deadline.

Your department registrar: Sabrina Whiteman at 203-432-1283 or sabrina.whiteman@yale.edu. Room AKW 002

Graduate School Policy

It is the student’s responsibility to familiarize themselves with all school policies. Specific questions about your concerns can be discussed directly with the Graduate Administrative Dean in addition to the DGS.
